Intro ducti on:	V-Ray is the renderer of choice for creating photo-realistic and very accurate renders. V-Ray is a ray tracing renderer and it's pairing with Rhino is especially favoured.
Prim	V-Ray is primarily a visualisation tool. Its main functions include:
ary funct ions:	 Rendering single frames Rendering sequential frames for customisation Creating irradiance maps Similar to V-Ray in terms of functionality is Mental Ray. Also HyperShot, which is Rhino's default renderer. Other rendering engines are Indigo. Flamingo, Penguin and Maxwell
funct	2. Rendering sequential frames for customisation 3. Creating irradiance maps Similar to V-Ray in terms of functionality is Mental Ray. Also HyperShot which is Rhino's default renderer. Other rendering engines are Indigo, Elamingo, Penguin and Maxwell Renderer. However, Flamingo is a non-realistic renderer producing scanline quality images. Penguin is non-realistic as well and deals primarily with unique "tone shading". It is possible that Bongo for Rhino will also provide some animation rendering.
funct	2. Rendering sequential frames for customisation 3. Creating irradiance maps Similar to V-Ray in terms of functionality is Mental Ray. Also HyperShot which is Rhino's default renderer. Other rendering engines are Indigo, Elamingo, Penguin and Maxwell Renderer. However, Flamingo is a non-realistic renderer producing scanline quality images. Penguin is non-realistic as well and deals primarily with unique "tone shading". It is possible that Bongo for Rhino will also provide some animation rendering. V-Ray's output naturally focus on visuals: 1. Printing of renders produced in V-Ray. Essentially, either the user produces images which are just quick, default renders great for exploring options and conceptual design work. Or, the user produces specific final photorealist renders.

Remember to therefore hide any faces that don't need to be seen. This will help to speed up the rendering time. In terms of the quality of the render image outputted, V-Ray has such a wealth of terms and options, that getting beyond a "default" (standard white) image can be a challenge. One handy and relatively quick way of getting beyond this is to take advantage of the preloaded render settings the software offers. This produces a range of aesthetics. However, the range, by being preloaded, still have a kind of generic aesthetic, which means that a customised look is still challenging to obtain. The only real solution is to get familiar with the

Usability with V-Ray is hard to evaluate as each

Stre ngth s /wea knes ses:	Over and above those strengths and weaknesses listed already, V-Ray at present is: + + Excellent for achieving highly customised render quality and render aesthetic. + + Very good at conducting simple renders with just standard materials and global illumination. Good for quick renders at conceptual stages. + + Excellent in terms of lighting and depth of field A bit overwhelming sometimes due to having so many rendering settings. Compared to V-Ray, a renderer such as Mental Ray is easier to adjust and quicker to render.
Lear ning supp ort:	Good software tutorials can be found online. Many of them are geared towards teaching V-Ray paired with Max, which means that there will be some differences in use and layout of the renderer interface when it is paired with Rhino. Note that: 1. Rhino offers a V-Ray manual which is very helpful and goes through example of lighting and material in combination with sample files. Found here. 2. The official website provides downloadable materials, scenes and render settings. 3. Many forums provide downloadable materials also. 4. Spot3D is a good resource. 5. The official manual for V-Ray is good. To get you started MakeLAB suggest the following tutorials: 8. Beginner B. Beginner B. Beginner C. Beginner D. You will also likely find interesting: 1. Intermediate A. Intermediate B. Intermediate B. Advanced A: Depth of Field and Bokeh Effects Advanced B: ASGvis Webinars
Addi tiona I:	"The physical camera option is perhaps most interesting as it's able to simulate depth of field. Also the real time rendering (when introduced) will be great as it'll make adjusting settings easier (with prior experience with real time rendering in Hypershot I found it a lot easier to make changes to the default by having a real-time preview of the render." V-Ray sometimes produces error messages without giving a specific reason for them. Usually it is because the resolution for the render is set too high, or the geometry is too complex. This site has detailed steps for working around this with irradiance maps. However, this doesn't always resolve the issue.
